A; Title: A bacterial methyltransferase M.EcoHK311 requires two proteins for in vitr A; Recession: S53984
A; Accession: S53984
A; Molecule type: DNA
A; Restances: EMBL: X82231; NID:95175351; PMID:9639973
A; Restances: EMBL: X82231; NID:9639971; PID:9639973
A; Restances: EMBL: X82231; NID:9639971; PID:9639973
A; Note: the authors translated the codon TTG for residue 97 as Met
A; Note: part of this sequence, including the amino end was confirmed by protein seq
C; Complex: heterodimer; beta chain is encoded by an alternative reading frame with:
C; Superfamily: Escherichia coli site-specific DNA-methyltransferase (cytosine-specific Skeywords: heterodimer; methyltransferase; restriction modification system; S-aden.

TISSUE SPECIFICITY: MAMMARY GLAND; MILK.
POLYMORPHISM: THREE ALLELES OF ALPHA-S2 CASEIN ARE KNOWN: A, B AND
C. THE FREQUENCIES OF THE ALLELES IS ESTIMATED TO BE 0.85, 0.04
AND 0.11 IN THE FRENCH DALRY BREEDS 'ALPINE' AND 'SAANEN'.
SIMILARITY: BELONGS TO THE ALPHA-CASEIN FAMILY.

J. PREDIATION SET REPORTS VIRAL TRANSCRIPTION AND DNA REPLICATION.
IT BINDS TO THE EZER RESOLATORY REGION. IT CAN EITHER
ACTIVATE OF REPRESS TRANSCRIPTION DEPRNDING OF EZRE'S POSITION
WITH REGARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS
BY STERICALLY HINDERING THE ASSENBLY OF THE TRANSCRIPTION
INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA

J. Bacteriol. 179:4802-4810(1997).
-!-FUNCTION: IN BUBACTERIA PREPP (GUANOSINE 3'-DIPHOSPHATE 5-'DIPHOSPHATE) IS A MEDIATOR OF THE STRINGENT RESPONSE THAT COORDINATES A VARIETY OF CELLULAR ACTIVITIES IN RESPONSE TO CHANGES IN UTRITIONAL ABUNDANCE. HIS ENZARE CATALYSES THE DEGRADATION OF PROEP INTO GDP. IT MAY ALSO BE CAPABLE OF CATALYZING THE SYNTHESIS OF PROEP (BY SIMILARITY).
-!-CATALYZING ACTIVITY: Guanosine 3',5'-bis(diphosphate) + H(2)O guanosine 5'-diphosphate + diphosphate.
-!-COFACTOR: MANGANESE (BY SIMILARITY).
-!-SIMILARITY: BELONGS TO THE RELA / SPOT FAMILY.

(PPGPP synthetase I) ((P)PPGPP synthetase).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Harris B.Z., Kaiser D., Singer M.H.;
"The guanosine nucleotide (p)ppGpp initiates development and A-factor production in Myxococcus xanthus.";
Submitted (SEP-1997) to the EMBL/GenBank/DDBJ databases.
-1- FUNCTION: IN EUBACTERIA PPGPP (GUANOSINE 3'-DIPHOSPHATE 5-'
DIPHOSPHATE) IS A MEDIATOR OF THE STRINGENT RESPONSE THAT
COORDINATES A VARIETY OF CELLULAR ACTIVITIES IN RESPONSE TO
CHANGES IN NUTRITIONAL ABUNDANCE. THIS ENZYME CATALYSES THE
FORMATION OF PPPGPP WHICH IS THEN HYDROLYSED TO FORM PPGPP (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SIMILARITY),
CATALYTIC ACTIVITY: ATP + GTP = AMP + guanosine 3'-diphosphate 5'-
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                      They are derived from the formulae.

Xaa Glu-Arg, Arg-Glu-Xaa, Xaa-Arg-Glu, or Glu-arg-Xaa, where
Xaa any amino acid residue.

Cyclic derivatives of the peptides also function as anti-inflammatory agents. The peptides can be covalently linked to one another either directly or through a spacer. The peptides and their derivatives have macrophage inhibitory and T-cell inhibitory activity and thus, anti-inflammatory activity. The peptides and compositions have anti-inflammatory activity. The peptides and compositions have anti-inflammatory activity in- inhibitory effects against a cellular and humoral immune response, including a response not associated with inflammation. The peptides also inhibit the ability of macrophages and T-cells to adhere to extracellular matrix components and fibronectin, as well as up-regulated fas receptor expression in T-cells. They can be used to inhibit unwanted immune reaction and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW56171-248 represent anti-inflammatory tripeptides of the invention. They are derived from the formulae:
Xaa-Glu-Arg, Arg-Glu-Xaa, Xaa-Arg-Glu, or Glu-arg-Xaa, where

Naa = any amino acid residue.

Cyclic derivatives of the peptides also function as anti-inflammatory agents. The peptides can be covalently linked to one another either addirectly or through a spacer. The peptides and their derivatives have macrophage inhibitory and T-cell inhibitory activity and thus, anti-inflammatory activity. The peptides and compositions have anti-immune activity, i.e. inhibitory effects against a cellular and humoral immune response, including a response not associated with inflammation. The peptides also inhibit the ability of macrophages and T-cells to adhere to extracellular matrix components and fibronectin, as well as up-regulated fas receptor expression in T-cells. They can be used to inhibit unwanted immune reaction and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            electrophoresis, particularly capillary isoelectric focusing electrophoresis. The peptide contains at least on tryptophan amino acid residue for detection in the UV absorption range. The markers (AAMV8164-W78379) provide sharp isolation, large UV absorption intensity and wide range of pI, and can be easily handled.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Marker peptide; capillary isoelectric focusing electrophoresis; IEF; pI; tryptophan; detection; UV absorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This peptide is a synthetic marker peptide used for isoelectric focusing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         öλ
                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to modulating agents for inhibiting or enhancing desmosomal cadherin mediated cell adhesion, comprising a modulating agent comprising a desmosomal cadherin cell adhesion recognition CAR sequence (ABB47341-ABB47262), a non-peptide mimetic of a desmosomal cadherin CAR sequence, a substance such as an antibody or antigen-binding fragment that specifically binds a desmosomal cadherin CAR sequence and/or a polynucleotide encoding a polypeptide that comprises a desmosomal cadherin CAR sequence or analogue. The modulating agents have immunosuppressive, cytostatic and antiapoptotic activity and are used to facilitate wound healing and/or reduce scar tissue, for enhancing adhesion of foreign tissue implants (e.g. skin graft or organ implant), treating an autoimmune blistering disorder and to treat cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                              Modulating agents for inhibiting or enhancing desmosomal cadherin mediated cell adhesion, useful for facilitating wound healing and/or reducing scar tissue, treating cancer and inducing apoptosis -

                                                                                                                                                                                                                                                                                                                        the calpha atom, or together with RD forms an alkylidene group, or is H where one of RA, RA' RD and RE is other than hydrogen"
                                                                                                                                  Gaps
                                                  The sequence is an active-site compound which blocks immune-complex binding to Ig Fc receptors and/or Ig binding to lymphocyte Fc receptors. The peptide modulates immune complex-mediated immunosuppression, inflammation and tissue disruption, and reduces human allergic responses.
                                                                                                                                 0;
                                                                                                                                                                                                                                                               Hemoregulatory peptide; inhibition; cell division;

Peptides based on this sequence may be used for inhibiting cell division,particularly myelopoietic or bone marrow cells. They can be used to inhibit proliferation of cells in the treatment of cancer, autofimmune diseases or psoriasis. They may also be used to generate antibodies for use in immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptide(s) contg. tyrosine or phosphorylated analogues - used
